

THANK YOU FOR PURCHASING NEWLEAF SCOOP HOLDER

Tools needed: None

1. Identify Parts

Locate your lid, scoop holder, tether, and bin body and prepare for installation / assembly.

2. Scoop Holder

The scoop holder is actually two parts: a holster, and the connector clip. These two fit together by sliding the clip into the holster grooves forming one piece.

Tab and Groove

3. Locate the Mounting Tab

Locate the scoop holder tab which is on the front lip of the scoop bin lid. For easier installation, you will want to work with the lid off of the bin body.

4. Get In Line

Holding the scoop holder in your hand with the open end (grayish connector) facing upward, align the tab on the lid with the rectangular slot. If you roll the groove over the lower tab edge to align and push, you may have better success.

5. Push Into Place

You may find it easier to push the scoop holder onto the tab and groove if it is properly aligned. Stronger than normal force may be needed, but ensure the tab and opening are aligned.

Properly Aligned

6. Snap to It

You will hear and feel the scoop holder "SNAP" into place when you have correctly installed it. Additionally, you will be able to see the clear tab protrude through the rectangular opening in the gray connector (as shown).

7. Prepare for Use

Install your scoop and tether. Tether snaps into holes on scoop and holster. Fill bin with product, and insert your label.

Support Tab

Screw Location

8. Similar Installation for 12 Gallon Bins

Instead of snapping on the lid, the wire scoop holder secures to the bin body via screw. Notice the support tab alignment.
